

## Copyrighted by eXtremepow.com - eXtreme File Hosting v1.5

Thank you for purchasing eXtreme File Hosting PHP script. eXtreme File Hosting is a multi function hosting script that allows visitors to upload zip file, video file, flash file, audio file and photo online! The script supports uploading of .zip, .mpg, .avi, .wmv, .rm, .mp3, .wma, .jpg, .gif, .tiff, and many more!

Here are the instructions on how to setup this script (read them carefully):

- 1) Extract all of the files somewhere on your webspace.
- 2) Open the "settings.inc.php" configuration file and edit it:

```
$mysql_host="your_host_name.com";  
$mysql_username="your_username";  
$mysql_password="your_password";  
$mysql_database="your_database";
```

```
//-----  
//-----Do not modify anything under this line!-----  
//-----
```

(It is a good idea to create a new database for this script to avoid putting many different tables onto one existing database)

Open photo/includes/settings.inc.php, fill the database details as what you filled above.

Open video/includes/settings.inc.php, fill the database details as what you filled above.

Open audio/includes/settings.inc.php, fill the database details as what you filled above.

- 3) Edit your php.ini file! This is required in order to handle large file uploads.

Typically, the things that need to be changed are:

**memory\_limit = 8M** ; Maximum amount of memory a script may consume (8MB)  
**upload\_max\_filesize = 20M** ; Change it to the max file size you allowed for uploading  
**post\_max\_size = 8M** ; Set this to double the size of upload\_max\_filesize

- 4) Grant ALL permissions (on Linux: CHMOD 777) on the folder where you uploaded this script (this is temporary). Meaning, if you upload to public\_html, please set public\_html to "777". When done installing, you should place your old permission settings back 750.

5) Grant ALL permissions (on Linux: CHMOD 777) on the "temp" folder that comes with your script! (this is permanently, because it will be used to handle uploads). Grant 777 to:

*/temp*  
*/files*  
*video/video*  
*video/temp*  
*audio/audio*  
*audio/temp*  
*photo/img*  
*photo/temp*

Do NOT set the permissions back to normal!

Go to htaccessprotection, open .htaccess, change "http://www.extremepow.com/demo" to yourdomain.com. This file is very important, it protects all uploaded files from being leeched.

Open htaccessva, edit "http://www.extremepow.com/demo" to your own domain where this script is hosted.

Open the following files:

*/getlinks.php*  
*/video/getlinks.php*  
*/photo/getlinks.php*  
*/audio/getlinks.php*

*/sendtofriend.php*  
*photo/sendtofriend.php*  
*video/sendtofriend.php*  
*audio/sendtofriend.php*

Search for all "extremepow.com/demo/" and replace with "your-domain.com".

6) Run the "install.php" script from your browser and follow the instructions. After running the install script you will see,

**The script is now installed. Please click on "Admin panel" to configure your settings.**

**It is highly advised to change your password as soon as possible.**

**Your current password is "admin" and your username is always "admin".**

**Admin panel**

**You can install the photo addon script here.**

**Please follow to install the photo addon script.**

7) You are all set! After you have installed this script, it is very important to log in to your administration panel and set your FTP server options, change your default password and configure any other available options. Default admin username and password is “admin”.

However, do not login without having your license key on hand. The first time you login, you will be redirected to [www.yourdomain.com/register.php](http://www.yourdomain.com/register.php) asking you to enter your username and your license key. If you fail to do so the first time, please delete `key.php` and try again with the `login.php`, it will redirect you to `register.php` again.

ADMIN PANEL: [www.yourdomain.com/admin.php](http://www.yourdomain.com/admin.php)

PHOTO ADMIN PANEL: [www.yourdomain.com/photo/admin.php](http://www.yourdomain.com/photo/admin.php)

Remember to delete `/install.php` and `/photo/install.php`. To login to the `photo/admin.php`, you must first login to `/admin.php`.

Enter into ADMIN Panel and start setting the settings. Also, at `getlinks.php` of each directory, find all <http://www.extremepow.com/demo> and replace with your domain name.

Open `/mail.php`, `video/mail.php` and `audio/mail.php`, find “eXtremepow” and replace with your site name.

-----  
**IP Tracker:**

Remember to login to your cpanel and set a cron job for clearing the ip tracker. eXtreme file hosting has an IP tracker that automatically stores visitors' ips. In Cpanel, go to cron job -> Standard:

Cron job command:

`wget -q --delete-after http://www.yourdomain.com/cleanup.php?confirmation=yes`

Set the interval to be x minute, every hour, everyday, every month, every weekday.

-----  
GOOD LUCK!
